

On each trial you will be presented with (5 or 8) coloured squares to remember. Following a brief delay, with a mask to remove sensory memory, a test screen will be presented.

Your task is to indicate whether or not a change has occurred between study and test. The number of changes you need to look out for will vary.

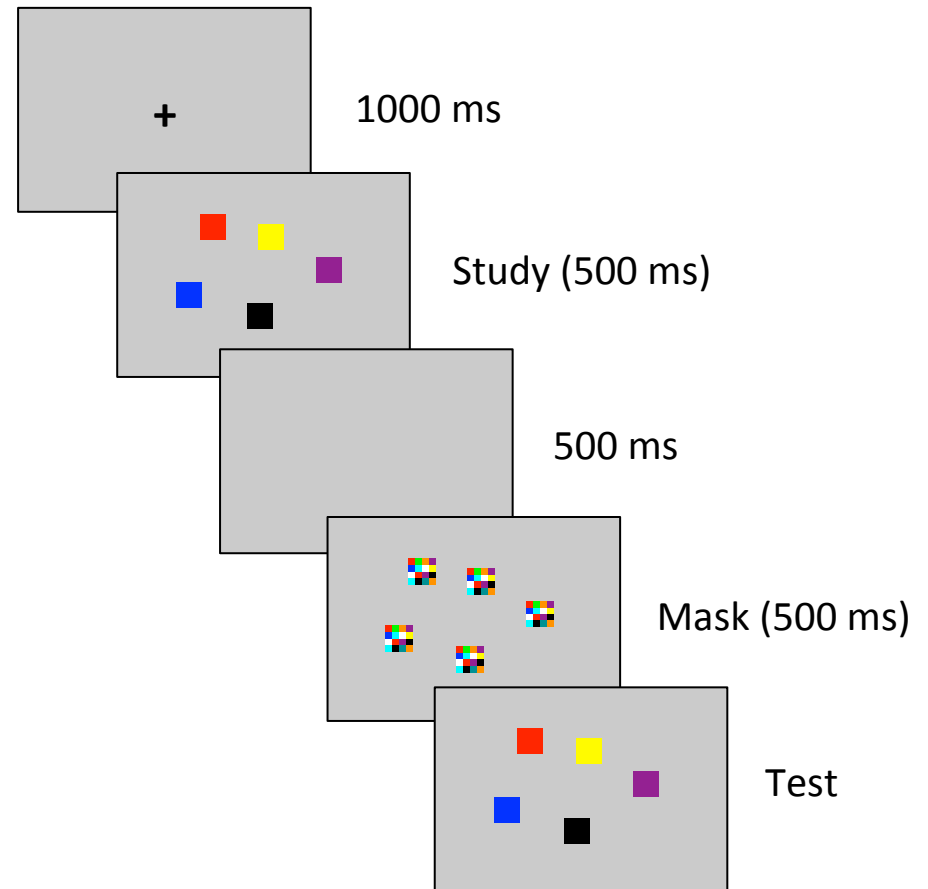

Here is an example of a trial where the correct response is *change*.

Next →

Here is an example of a trial where the correct response is *same*.

Please respond as quickly and accurately as possible.

This experiment is split into 8 blocks of trials.

Before each block you will be told how many squares could change colour.

Keep this in mind as this will help you get the correct answer.

When a change occurs squares will change to colours that were not in the original study set.

If you have any questions please ask me now.
